A: The problem is solved now. The dll is 32 bit and I have a 64 bit version of the GAUSS program. In this case the memory access error occurs. I made sure the memory settings were the same between 32 bit and 64 bit machines and this solved it. [Anesthetic management of three patients with factor XIII deficiency undergoing abdominal surgery with antifibrinolytic therapy]. Three patients (aged 15, 20 and 39 years) with factor XIII deficiency undergoing abdominal surgery under the administration of antifibrinolytic agents were anesthetized using ketamine and pentobarbital. After stopping the circulatory function with heparin, the drugs were administered intravenously as a bolus of tranexamic acid (1.0-1.5 g), aprotinin (7.5-10.0 g) or epsilon-aminocaproic acid (150-250 mg). In the two patients with factor XIII deficiency, the coagulopathic changes of the resected specimens were not observed and the postoperative bleeding was not seen. In these two patients, the total doses of the drugs were lower than those of the patient with no antifibrinolytic therapy. On the other hand, the postoperative bleeding occurred in one patient, who received 150 mg of epsilon-aminocaproic acid. The patient underwent an emergency surgery for acute abdominal hemorrhage and was successfully treated with fresh frozen plasma (150 ml). Based on these clinical experiences, we conclude that the doses of antifibrinolytic agents for the patients with factor XIII deficiency should be reduced or transfusion of fresh frozen plasma should be performed according to the extent of coagulation disorder. In the physical layer of a digital communication system, data symbols, or bits, are encoded and transmitted over a channel. For example, the channel may represent the airwaves of an RF (radio frequency) communication system, where the data symbols are modulated to correspond to various information being communicated over the airwaves. The modulated data symbols are demodulated at the receiver to produce decoded data symbols. The channel may also represent wires or optical fibers connecting transmitters and receivers, or the channel may represent a transmission medium, such as a printed circuit board, which carries data in electrical form. The channel may represent any communication medium between transmitters and receivers. The channel may represent any medium through which information is communicated, including wires, cables, 82157476af
